WEB DEVELOPMENT PROJECT REPORT

Design and Development of Three Websites Using HTML and CSS

Submitted by: J. Surya Kiran

Course: B.Tech – Computer Science and Engineering

Year: First Year

Subject: Web Development

College Name: _____

Faculty Name: _____

Academic Year: _____

1. Introduction

Web development is the process of creating websites and webpages. HTML (HyperText Markup Language) provides the structure of a webpage, while CSS (Cascading Style Sheets) controls its appearance, including colors, fonts, spacing, borders, and layouts.

This project report describes three websites developed for practice using basic HTML and CSS: an Electronics Store Website, an Online Food Ordering Website, and a Hotel Reservation Website.

2. Objectives

- To understand the basic structure of webpages using HTML.
- To apply CSS for colors, fonts, spacing, backgrounds, and layouts.
- To practice creating navigation bars, cards, tables, images, and forms.
- To design clear and user-friendly website interfaces.
- To gain practical experience in frontend web development.

3. Technologies and Tools Used

HTML: Used to structure webpage content, headings, links, images, tables, and forms.

CSS: Used to style webpages with colors, backgrounds, typography, spacing, borders, and responsive layouts.

Code Editor: Used to write and edit HTML and CSS files.

Web Browser: Used to open and test the websites.

4. Projects Developed

4.1 Electronics Store Website

The Electronics Store Website presents an online catalog for electronic products such as laptops, smartphones, accessories, and smart devices. The interface can include product cards, product specifications, discount labels, category sections, and comparison tables.

Main concepts practiced: product cards, images, headings, specification tables, discount labels, and organized product layouts.

4.2 Online Food Ordering Website

The Online Food Ordering Website displays restaurants and food items in a simple interface. It can include restaurant details, menu categories, food images, prices, special offers, customer reviews, and order buttons.

Main concepts practiced: menu sections, food cards, images, prices, buttons, navigation, and grid layouts.

4.3 Hotel Reservation Website

The Hotel Reservation Website presents hotel room options and reservation information. It can include room categories, room images, facilities, tariffs, check-in and check-out fields, and a reservation form.

Main concepts practiced: room cards, forms, labels, input fields, buttons, images, and responsive sections.

5. Implementation Process

- **Step 1 – Create HTML files:** Make a separate HTML file for each website.
- **Step 2 – Add content:** Include headings, paragraphs, images, links, product or service details, and forms as needed.
- **Step 3 – Apply CSS:** Set suitable colors, fonts, spacing, borders, backgrounds, and layouts.
- **Step 4 – Organize the layout:** Use cards, grids, sections, and navigation links to arrange the content.
- **Step 5 – Test in a browser:** Open each file and check the appearance, images, links, and layout.

6. Common Features

- Clear headings and organized content.
- Navigation links for moving between sections.
- Images and cards to present products, food, or hotel rooms.
- CSS styling for colors, typography, spacing, and backgrounds.
- Tables or structured details where comparisons are useful.
- Forms and buttons shown as part of the website interface.

7. Learning Outcomes

- Learned how HTML elements are used to structure a webpage.
- Practiced using CSS selectors and styling properties.
- Gained experience organizing content with cards and grid layouts.
- Learned how different websites present information for different purposes.
- Improved basic frontend design and debugging skills.

8. Limitations

- These projects primarily demonstrate the frontend interface.
- HTML and CSS alone do not process orders or make hotel reservations.
- Data storage, account management, and payment processing require additional technologies.
- Interactive behavior may require JavaScript, and server-side features require a backend.

9. Future Enhancements

In the future, JavaScript can be added to make buttons, filters, and forms interactive. Backend technologies and databases can be used to process orders, store product details, and manage hotel reservations. Responsive design can also be improved for different screen sizes.

10. Conclusion

This project provided practical experience in creating three website interfaces using HTML and CSS: an Electronics Store Website, an Online Food Ordering Website, and a Hotel Reservation Website. Through these projects, basic webpage structure, styling, cards, tables, images, navigation, and forms were practiced. The work provides a foundation for learning JavaScript and more advanced web development.
